(*1) Conditions: Ta=25 degree C Typical value at maximum output power (Inrush current value doesn't include part of within 0.1msec to input filter)
 (*2) The typical ripple voltage in the standard specification is a value measured using 100MHz oscilloscope in the anechoic chamber under the JEITA measuring method (Condition: Ta=25°C, Vin=100Vac Typical value at rated output)
 (*3) Upon over voltage or over current conditions, input power must be removed to allow unit reset to occur within a few minutes.
 (*4) Derating is required by operating temperature. Follow the overload and specification in manual to avoid the damage of power supply.
